Units in FEA

Finite element software requires the use of a consistent set of units.

A good choice of units is usually based on an appropriate length scale for your problem—for example, use units of mm or inches for handheld objects. You may need m or feet for large objects.

Example Unit System: N-mm SI

length: mm

Force: N

stress = force/area = N/mm² = MPa

This means when stresses are displayed, the unit will be MPa.
The modulus of elasticity will need to have units of MPa.

The choice of units has additional implications.

density in N-mm SI

Suppose we need to use the density of steel in our model.
density = 7.75 g/cm^3

****be very careful****

We need to derive the units of mass in our N-mm system.
 $F = m a$ ($a = \text{gravity when } F = \text{weight}$)

density in N-mm SI

$$F = m a$$

$$N = \text{mass mm/s}^2$$

$$\text{mass} = (N * s^2)/\text{mm}$$

$$N = \text{kg m/s}^2$$

$$\text{mass in our system} = \text{kg m/s}^2 * s^2/\text{mm} = \text{kg m/mm} = 1000 \text{ kg}$$

$$1000 \text{ kg} = \text{tonne}$$

for us, density needs to be in $1000 \text{ kg/mm}^3 = \text{tonne/mm}^3$

density in N-mm SI

$$7.75 \text{ g/cm}^3$$

$$= 7.75 * 1 \text{ kg}/1000 \text{ g} * 1 \text{ cm}^3/1000 \text{ mm}^3$$

$$= 7.75 \times 10^{-6} \text{ kg/mm}^3 = 7.75 \times 10^{-6} * 1 \text{ tonne}/1000 \text{ kg}$$

$$= 7.75 \times 10^{-9} \text{ tonne/mm}^3$$

density in in-lb system

Things get really tricky in Imperial Standard Units

density of steel = 490 lbs/ft³

Two issues:

lbs is not mass!

we need in³ and not ft³

$$490 \text{ lbs/ft}^3 = 490 \text{ lbs/ft}^3 * 1 \text{ ft}^3 / 12^3 \text{ in}^3 = 0.2836 \text{ lb/in}^3$$

density in in-lb system

$$F = m a$$

$$a = \text{gravity} = 32.2 \text{ feet/s}^2$$

1 cubic inch of steel should weigh 0.2836 lbs

$$0.2863 \text{ lbs} = \text{mass} \cdot 32.2 \text{ ft/s}^2 = \text{mass} * 32.2 * 12 \text{ in/ft ft/s}^2$$

$$\text{mass} = 0.2863 / (32.2 * 12) \text{ lbs s}^2/\text{in} = 741 \times 10^{-6} \text{ snails}$$

$$(1 \text{ slug} = \text{lbs s}^2/\text{ft})$$

$$(1 \text{ snail} = \text{lb s}^2/\text{in})$$

density in in-lb system

Finally, since we were considering 1 cubic inch of steel, the density value we need to use is:

$$7.41 \times 10^{-4} \text{ snails /in}^3$$

or

$$7.41 \times 10^{-4} \text{ lbs s}^2/\text{in} / \text{in}^3$$

Other Units

You only need to input the types of materials properties that are used for the analysis.

Be extremely careful in heat transfer with energy units, heat flux units, etc.

Fortunately, someone has made a “cheat sheet” for us: (refer to Endurasim website).

Recommendation

Most journals will expect SI units.

Most objects can be modeled appropriately with a mm length scale.

Therefore, I recommend using the N-mm system all the time, unless there is a good reason to not use N-mm.

In any event, always be careful.

Single or Double Precision?

Along with your choice of unit system if your choice of machine representation of your numbers.

IEEE-Std 754: IEEE Standard for Floating Point Arithmetic defines the bit resolution of floating point number for computers.

The single precision IEEE FPS format is composed of 32 bits, divided into a 23 bit mantissa, M , an 8 bit exponent, E , and a sign bit, S .

16, 32 or 64 bit representations may depend on the computer you use.

$$7.75 \times 10^{-9} \frac{\text{tonne}}{\text{mm}^3} * \text{Volume} (\text{mm}^3) = \text{Mass} (\text{tonne})$$

$$\text{Mass} (\text{tonne}) * g \left(9.81 \frac{\text{m}}{\text{s}^2} \frac{1000 \text{mm}}{\text{m}} \right) \Rightarrow \text{FORCE} \text{ N}$$

N

mm

$$\text{Stress} \frac{\text{N}}{\text{mm}^2} = \text{MPa}$$

Material Properties need to be consistent with this choice.

$$E_{\text{steel}} = 210 \text{ GPa}$$

$$= 210,000 \text{ MPa}$$

210 000.0

Input into code

$\nu = 0.3$ no units, just use this number

$$1 \text{ in} = 25.4 \text{ mm}$$

~~1~~

$$2.343 \times 25.4$$

$$24 \times 25.4 =$$

$$R_o = 304.8$$

$$R_i =$$

A hand-drawn table with 4 columns and 4 rows. The table is drawn with black lines on a white background. The top row is a solid horizontal line. The second, third, and fourth rows are drawn with horizontal lines that are slightly slanted downwards from left to right. The vertical lines are also slightly slanted, but more vertically oriented. The table is positioned in the upper left quadrant of the page.
